$ git clone
fatal: You must specify a repository to clone.

usage: git clone [<options>] [--] <repo> [<dir>]

    -v, --[no-]verbose      be more verbose
    -q, --[no-]quiet        be more quiet
    --[no-]progress         force progress reporting
    --[no-]reject-shallow   don't clone shallow repository
    -n, --no-checkout       don't create a checkout
    --checkout              opposite of --no-checkout
    --[no-]bare             create a bare repository
    --[no-]mirror           create a mirror repository (implies --bare)
    -l, --[no-]local        to clone from a local repository
    --no-hardlinks          don't use local hardlinks, always copy
    --hardlinks             opposite of --no-hardlinks
    -s, --[no-]shared       setup as shared repository
    --[no-]recurse-submodules[=<pathspec>]
                            initialize submodules in the clone
    --[no-]recursive ...    alias of --recurse-submodules
    -j, --[no-]jobs <n>     number of submodules cloned in parallel
    --[no-]template <template-directory>
                            directory from which templates will be used
    --[no-]reference <repo>
                            reference repository
    --[no-]reference-if-able <repo>
```

```
                              any cloned submodules will use their remote-tracking branch
    --[no-]sparse             initialize sparse-checkout file to include only files at root
    --[no-]bundle-uri <uri>
                              a URI for downloading bundles before fetching from origin remote
